Balance and Coordination

We help you to deal with it ...

New means of test and training

MediBalance Pro

Dear patients,

- You are suffering from vertigo and feel unstable walking or standing?
- You easily lose your sense of balance?
- Your blood pressure goes wild at times one way or the other, but your physician is unable to find the cause of it?
- You crave to improve your coordination and concentration?
- Your back bothers you frequently?
- Your muscles often are tense and causing pain?

NO? Then you belong to a very blessed group of patients – congratulations.

If you did answer one or even several questions with **YES**, please contact our staff and ask them about test and training questions with the **MediBalance Pro System**.

A thorough test procedure allows to evaluate both your sense of balance and your level of coordination. The results provide us with valuable indications as to how to best help your need with an individual and specialized training.

What is the test procedure?

The primary test routine consists of four steps. Your exact movements are being recorded and are the foundation of the corresponding analysis:

- Step 1: You stand on the *MediBalance Pro* platform relaxed the both legs.
- Step 2: You continue to stand on the platform but close your eyes.
- Step 3: Again you stand on the platform. However, the ground you stand on is being destabilized using a special cushion on top of the platform.
- Step 4: You continue to stand on the special cushion but close your eyes.

What is the training procedure?

Depending on your individual needs your *MediBalance Pro* specialist determines which specific training measures are best for you. An individual training to improve your sense of balance in daily life is being provided.

On a computer screen you receive specific tasks that you are asked to complete. At times you will i.e. move a virtual ball on the screen towards a specific location or into different screen sectors.
